A Mammal Embryo Worksheet Answers

In mammals, the blastula forms the blastocyst in the next stage of development. Here the cells in the blastula arrange themselves in two layers: the inner cell mass, and an outer layer called the trophoblast. The inner cell mass is also known as the embryoblast and this mass of cells will go on to form the embryo.

The endodermal cells continue through the interior of the embryo until they reach the other side, creating a continuous tract through the embryo; this tract is the archenteron, or embryonic gut. In protostomes, the blastopore becomes the embryo's mouth; in deuterostomes, the blastopore becomes the embryo's anus.

A more detailed version of the stages of mammalian embryonic development is below. E#. # represents the very defined embryonic stage of "days post fertilization" where E1 would indicate 1 day after fertilization. (Marikawa, 2006) Something to keep in mind is that while mouse and human development are similar, the timescale is rather different between the two- humans take longer to develop ...

Chapter 32 An Introduction to Animal Diversity Lecture Outline . Overview: Welcome to Your Kingdom. Biologists have identified 1.3 million living species of animals. Estimates of the total number of animal species run far higher, from 10 to 20 million to as many as 100 to 200 million.

Chapter 32 - An Introduction to Animal Diversity | CourseNotes

Embryo Definition. An embryo refers to the early developmental stage of eukaryotic organisms following the fertilization of an egg (derived from a female) by sperm (derived from a male) as a method of sexual reproduction. In animals, the initial diploid cell that results from the fusion of the egg and the sperm contains half the genetic information (DNA) from each of the parental cells and is ...
