5.5.3 Free vibration of undamped linear systems with many degrees of freedom. As an example, consider a system with  $n$  identical masses with mass  $m$ , connected by springs with stiffness  $k$ , as shown in the picture. Suppose that at time  $t=0$  the masses are displaced from their static equilibrium position by distances  $\delta_i$ , and have initial speeds  $\dot{\delta}_i$ .

There are 3 degrees of freedom in this problem since to fully characterize the system we must know the positions of the three masses ( $x_1$ ,  $x_2$ , and  $x_3$ ). Three free body diagrams are needed to form the equations of motion. However, it is also possible to form the coefficient matrices directly, since each parameter in a mass-dashpot-spring system has a very distinguishable role.

In order to control the mechanical vibration of multi-degree of freedom system, this paper proposes the practical application of dynamic absorbers and a new approach for these design. It is widely known that the design method for a dynamic absorber to one degree of freedom system has already been established.

An unrestrained multi-degree of freedom system experiences both rigid-body translation and/or rotation and vibration. The existence of a rigid-body mode results in a zero natural frequency. The corresponding mode shape is called the rigid-body mode.

5.4 Forced vibration of damped, single degree of freedom, linear spring mass systems. Finally, we solve the most important vibration problems of all. In engineering practice, we are almost invariably interested in predicting the response of a structure or mechanical system to external forcing.

## Dynamics and Vibrations: Notes: Forced Vibrations

In this paper, free vibration, steady-state vibration and transient vibration of multi-degree-of-freedom systems with non-proportional viscous damping are presented. Natural frequencies and the corresponding damping ratios are obtained by solving the complex eigenvalue problem with complex roots.

In Chapter 2, the vibration of a single degree of freedom system was studied. This is the simplest structural system. Actual structures are, of course, not as simple as this. They behave as lightly damped multi-degree of freedom systems.
